Question: The box plot shows the number of hours slept on vacation. What is the median of the data?

Answer choices:

- A 2
- B 6
- C 7.5
- D 8.5

Solution: C

The median of a box-and-whisker plot is the line inside of the box.

Since that line is sitting between 7 and 8, answer choice C of 7.5 can be the only correct choice.

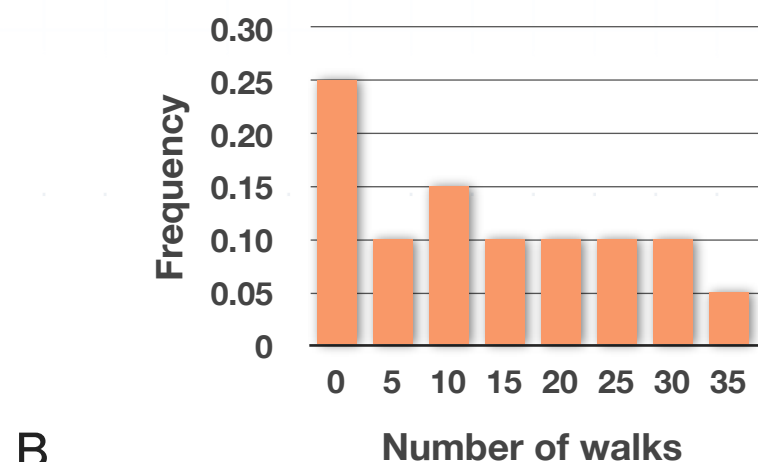

Topic: Box-and-whisker plots

Question: A dog walking business is keeping track of how many times each of its clients uses their business in the month of December. Which histogram matches the box plot?

Answer choices:

Solution: C

A box-and-whisker plot is divided into percentiles. 25 % of the data is in each section. Based on the box-and-whisker plot,

about

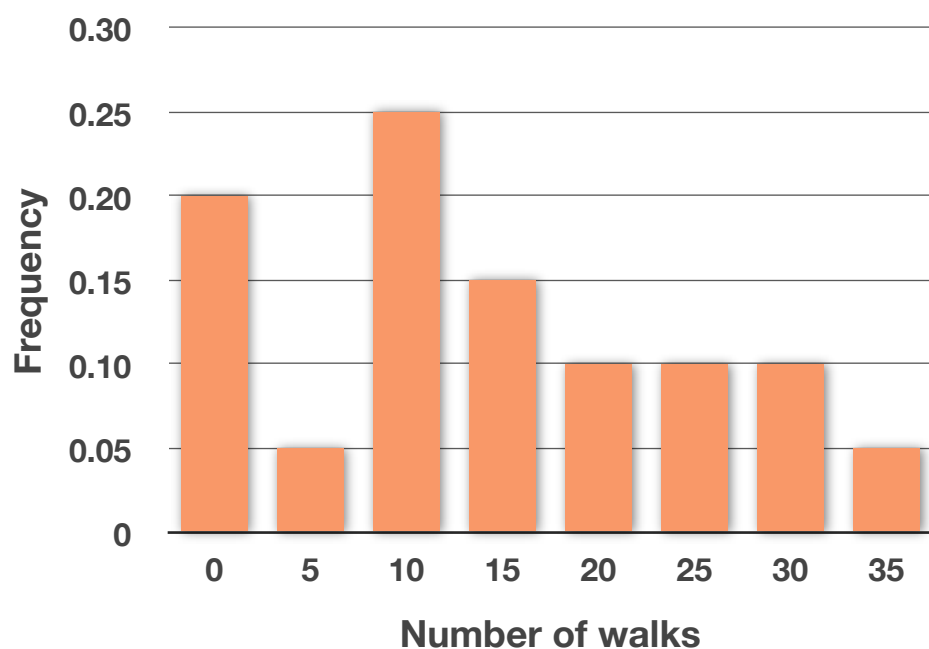

25 % of the data falls in the range 0 – 10,

25 % of the data falls in the range 10 – 15,

25 % of the data falls in the range 15 – 25,

25 % of the data falls in the range 25 – 35.

The only histogram that matches this distribution is

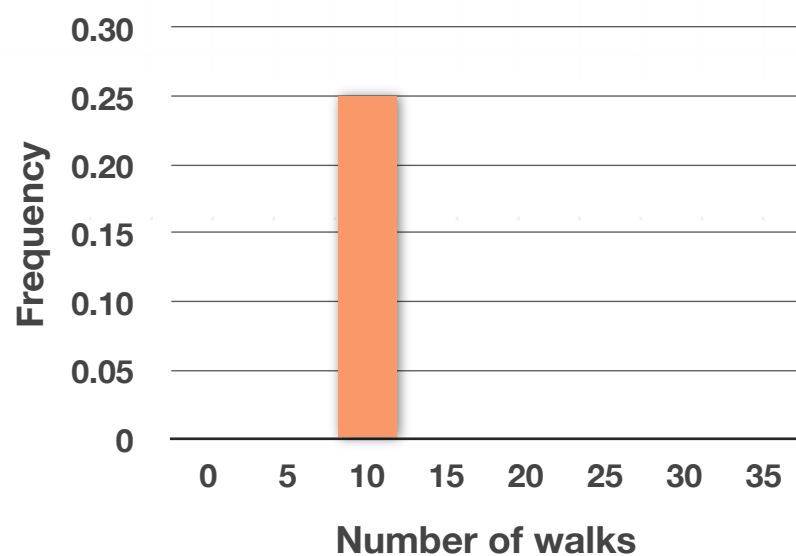

In this histogram,

roughly 25 % of the data is between 0 and 10, since the first two bars have a frequency of 0.25:

roughly 25 % of the data is between 10 and 15, since the third bar has a frequency of 0.25:

roughly 25 % of the data is between 15 and 25, since the next two bars have a frequency together of $0.15 + 0.10 = 0.25$:

roughly 25 % of the data is between 25 and 35, since the last three bars have a frequency together of about $0.10 + 0.10 + 0.05 = 0.25$:

Question: If the first quartile is equal to 15 and the third quartile is equal to 25, which statement is true?

Answer choices:

- A The median is 20.
- B The mean is between 15 and 25.
- C Both statements are true.
- D With the information provided, it's impossible to say whether A or B is true or false.

Solution: D

If the first quartile is equal to 15 and the third quartile is equal to 25, you know the median is between 15 and 25. But you can't determine its exact value. The mean could be larger than 25 or smaller than 15 if there was an extreme outlier in the data set.
